

Welcome to FetchPro

Your computer's universal Internet gateway
fetchpro.teliapp.com

What is FetchPro?

Fetch is the perfect short and long term solution to providing remote workers and learners with fast, stable and secure Internet access on their computers.

Using the smartphone's charging cable, FetchPro creates a direct connection between the computer and the smartphone, turning the smartphone into a high-speed, stable, secure modem.

#WorkFromHome Problems

Speed & Stability

The health pandemic has forced over sixty percent of American workers to work from home. Keeping a fast and stable Internet connection is not easy with other household members also working from home, remote learning, playing video games, streaming content – all using up limited bandwidth on the home WiFi network.

Security

Businesses secure workplace Internet infrastructure to ensure the highest levels of data and network security. Yet, remote workers access the same work content, but on their home WiFi. With the existing home WiFi usage by family members, it becomes a daunting and impractical challenge to attempt to secure home WiFi networks. Yet, companies and their IT departments still need to protect company data.

#WorkFromHome Solutions

FetchPro enables Mac and Windows computers to access the Internet without fighting for Internet bandwidth on the home WiFi network and is the perfect solution for remote workers. Professionals using FetchPro do not use their home WiFi to access the Internet, thereby eliminating the need to secure their home WiFi infrastructure.

How fast is FetchPro?

Your computer will obtain the same Internet speeds as the smartphone to which it is connected.

FetchPro is not...

- ✗ a replacement for computer security software
- ✗ a replacement for a VPN

FetchPro is...

- ✓ an excellent add-on for computer security software
- ✓ a critical add-on for VPN users

Key Security Points

FetchPro offers cyber defense features including blocking non secure websites by blocking not https sites, encrypting all the DNS requests made by computer web browsers through TLS over DNS, and protecting Internet searches from third-party tracking.

FetchPro does not produce a wireless signal or broadcast signal of any kind, and instead establishes a wired connection from the iPhone or Android smartphone to the Mac or Windows computer. This means that the computer's Internet access is not known to any local devices, and remains completely undetectable to any other local WiFi or hotspot user.
